Aims

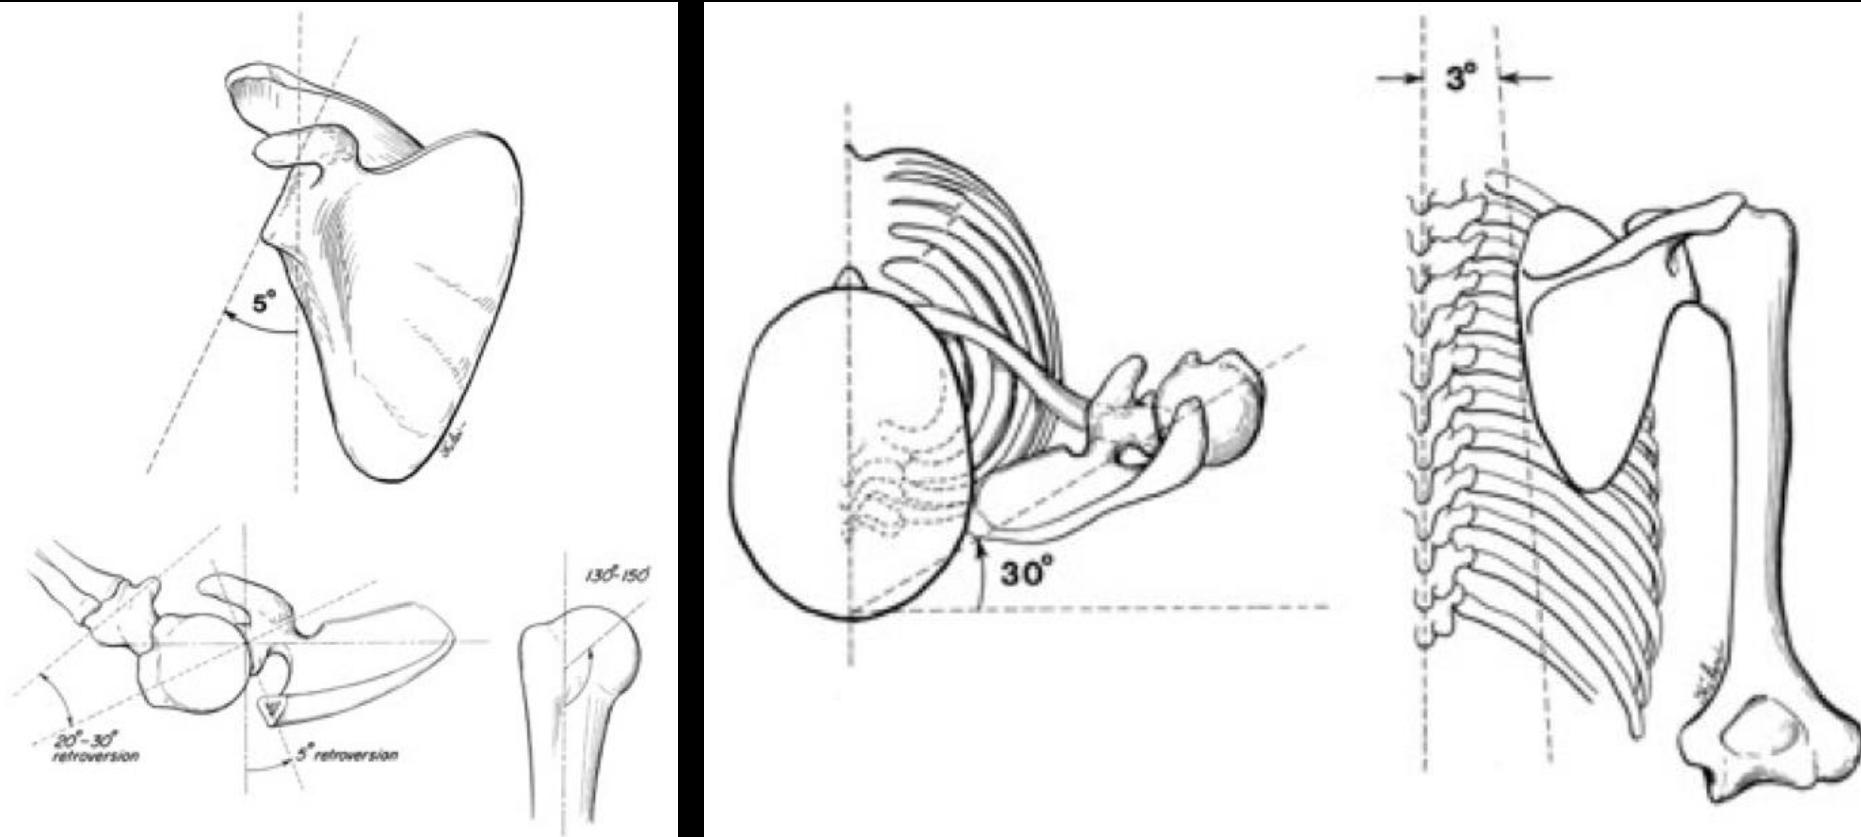

- Brief introduction
- Bony anatomy
- Static stabilisers of the GH joint
- Dynamic stabilisers of the GH joint
- Arthroscopic anatomy of the GH joint

Introduction

- Glenohumeral joint is a synovial ball and socket joint
- Ball is mean 43mm in diameter and the glenoid is 1/3 the size of humeral head
- Glenoid is highly congruent (1% deviation) to the humeral head
- Commonest joint to experience instability

Bony Anatomy

Bony Anatomy

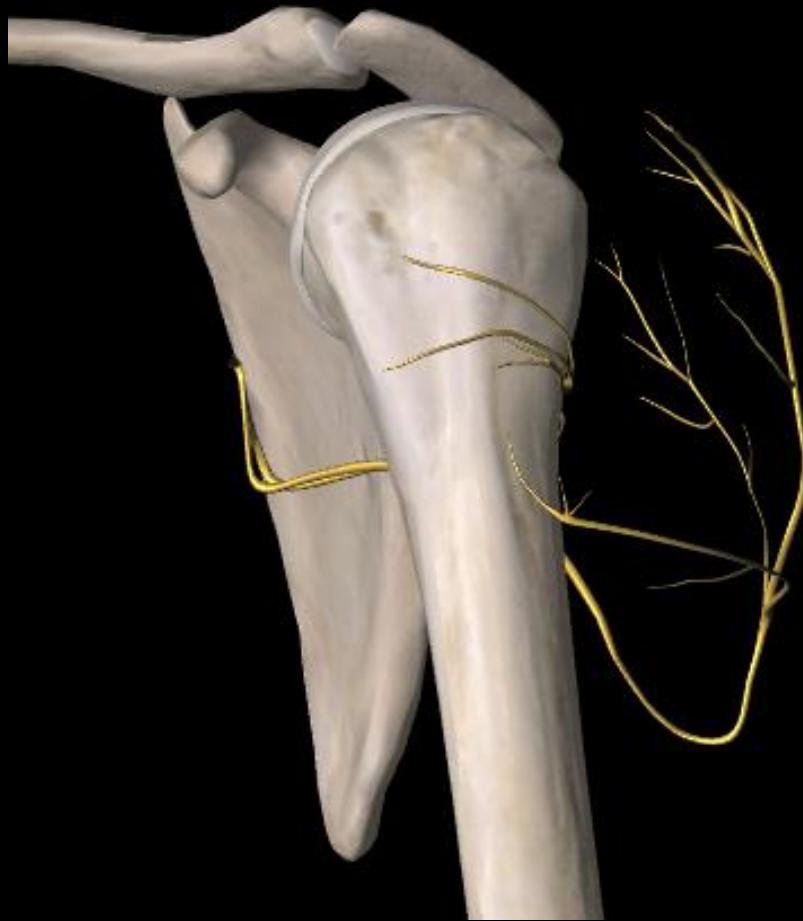

Glenoid fossa:

- 9mm in sup-inf plane
- 2.5mm in AP plane (5mm with labrum)

Neurovascular Structures

- Axillary nerve

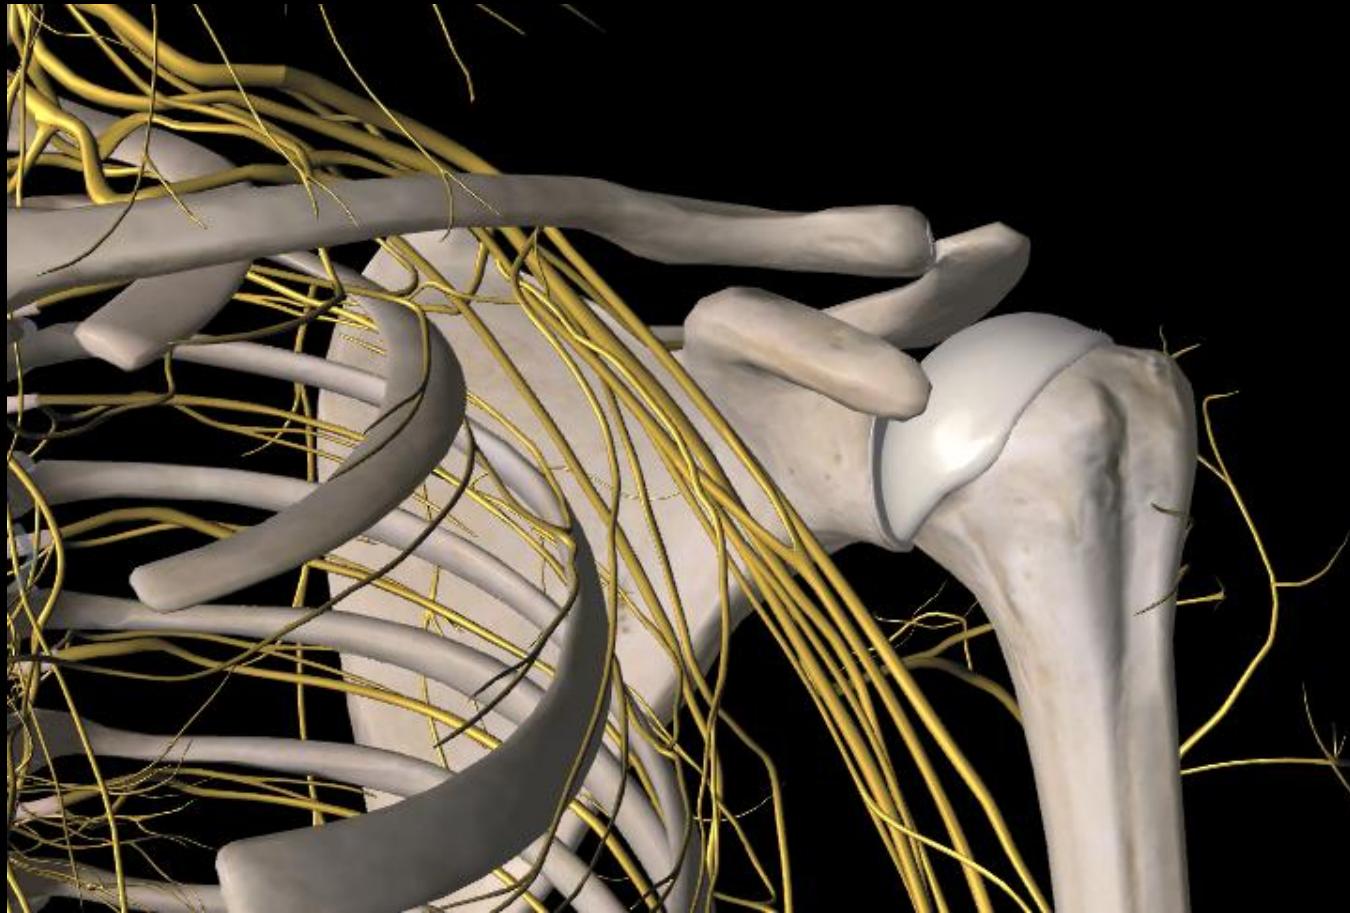

- Musculocutaneous nerve

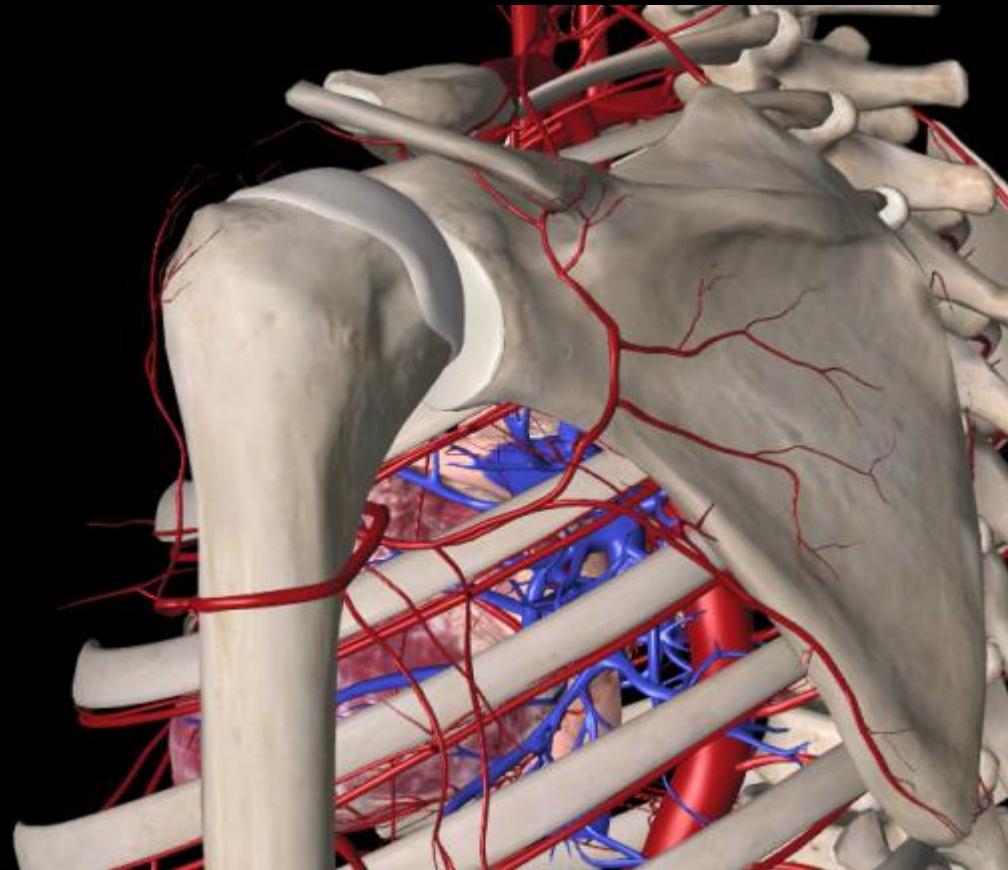

Neurovascular Structures

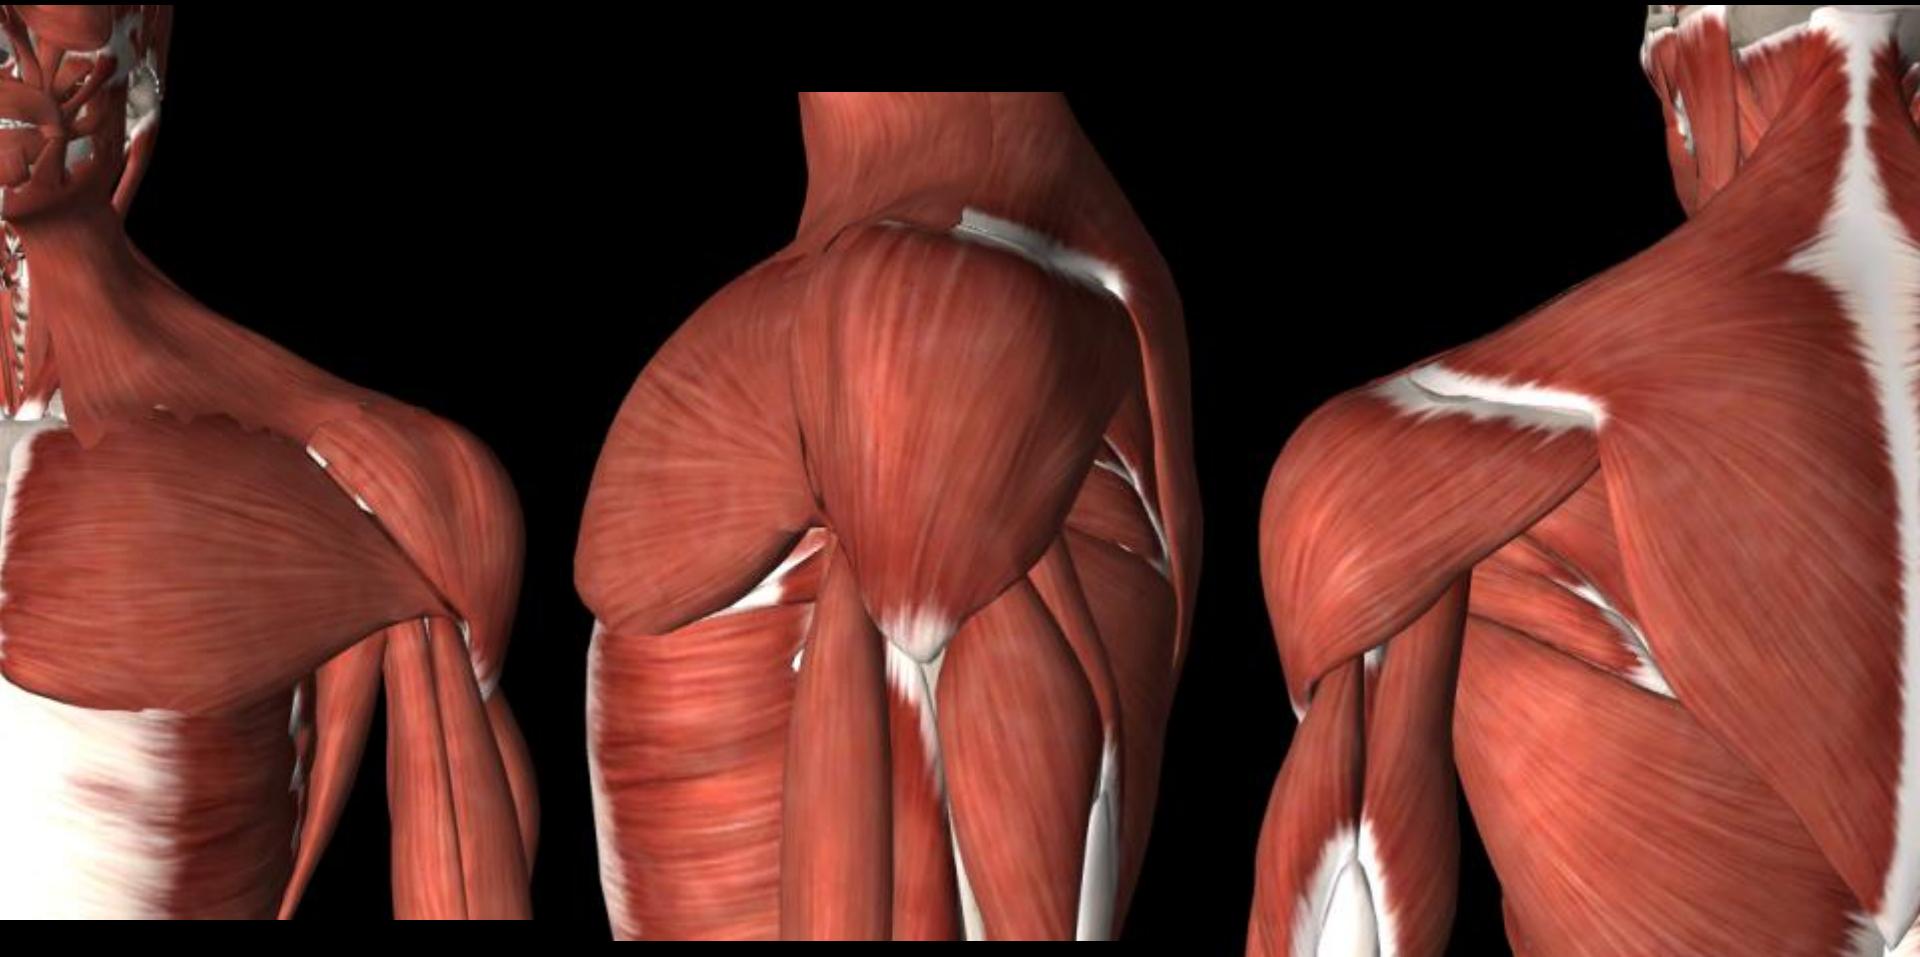

- Brachial Plexus

Static Stabilisers

- Articular version
- Labrum
- Articular conformity
- Negative intra-articular pressure
- Capsule ligaments
- Rotator cuff

Static Stabilisers

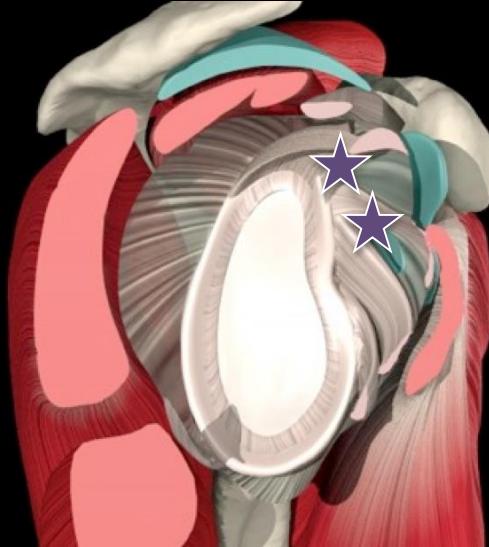

Static Stabilisers

Static Stabilisers

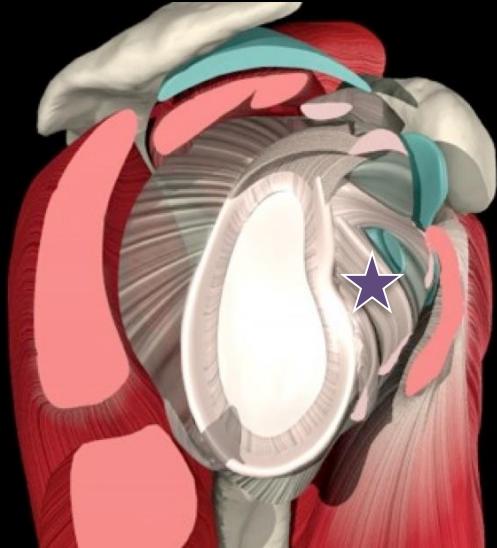

- Coracohumeral ligament
 - From coracoid to both tuberosities
 - Most consistently present condensation
- SGHL
 - Present in 90%; substantial in 50%
 - Just anterior to LHB → proximal lesser tuberosity
 - Important inferior stabiliser (most in ER)

Static Stabilisers

- MGHL

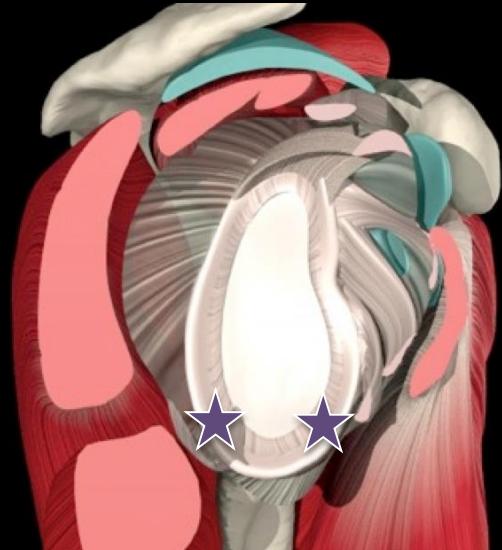

- Absent in 30%
- Inferior to SGHL
- Blends with SSc 2cm medial to insertion to LT
- Max tension in ER and lower angles of abduction (anterior stabiliser)
- Secondary restraint to inferior translation

Static Stabilisers

- IGHL

- “Hammock”
- Critical role in inferior and anterior stability
- Anterior labrum (anterior to posterior) to articular margin of humeral head
- Anterior band tight in abduction and external rotation
- Posterior band tight in flexion and internal rotation

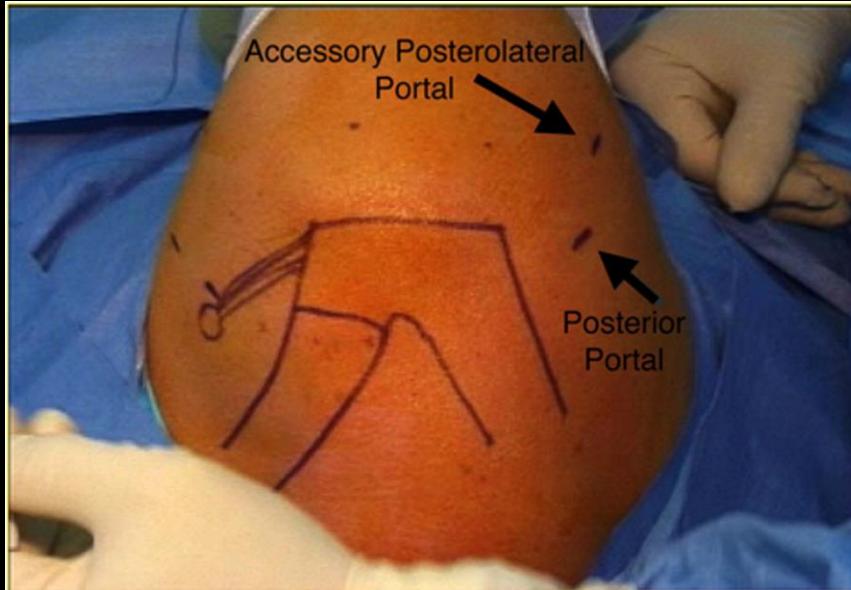

Dynamic Stabilisers

- Concavity compression
- Direct capsular tension
- Proprioception
- Scapular stabilisers
- Dynamic muscle action
- Biceps*
